4 4. Supplementary: Resonance vs Novelty by LLM Type 8

5 5. Session Information 10

0.1 Summary

- Humans produce higher novelty (surprisal) and higher transience than the model, indicating stronger deviations from earlier story context.
- Both agents display a positive novelty–resonance relationship (innovation bias), but the slope is steeper for humans.
- This indicates that surprising human turns exert greater forward influence on narrative development.
- AI contributions show lower variance and lower informational impact relative to human inputs.
- Humans are the primary drivers of narrative innovation and thematic redirection.

1 1. Data Loading and Preprocessing

1.1 1.1 Load Data

```
# Load Field Data
df_res_field <- read_csv(here("data/TEXT/processed/novelty_scores_40.csv")) %>%
  filter(!is.na(user_surprise) & !is.na(ai_surprise)) %>%
  mutate(
    user_resonance = user_surprise - user_transience,
```

```r
    ai_resonance = ai_surprise - ai_transience,
    datatype = "Field"
  ) %>%
  drop_na(user, ai) %>%
  filter(interaction_count > 1, interaction_count < 10, ai_surprise < 0)
```

1.2 1.2 Reshape Data

```r
# Compute word counts for each agent's turn
df_res_field <- df_res_field %>%
  mutate(
    user_nwords = str_count(user, "\\S+"),
    ai_nwords = str_count(ai, "\\S+")
  )

df_res_long <- df_res_field %>%
  pivot_longer(
    cols = c(user_surprise, user_transience, user_nwords,
             ai_surprise, ai_transience, ai_nwords),
    names_to = c("agent", "metric"),
    names_pattern = "(user|ai)_(surprise|transience|nwords)"
  ) %>%
  pivot_wider(names_from = metric, values_from = value) %>%
  mutate(
    resonance = surprise - transience,
    agent = factor(agent, levels = c("user", "ai"), labels = c("User", "LLM"))
  )
```

1.3 1.3 Descriptive Statistics

```r
desc_stats <- df_res_long %>%
  group_by(agent) %>%
  summarise(
    n = n(),
    mean_surprise = mean(surprise, na.rm = TRUE),
    sd_surprise = sd(surprise, na.rm = TRUE),
    mean_transience = mean(transience, na.rm = TRUE),
    sd_transience = sd(transience, na.rm = TRUE),
    mean_resonance = mean(resonance, na.rm = TRUE),
    sd_resonance = sd(resonance, na.rm = TRUE)
  )

print(desc_stats)
```

```
## # A tibble: 2 x 8
##   agent     n mean_surprise sd_surprise mean_transience sd_transience
##   <fct> <int>         <dbl>       <dbl>           <dbl>         <dbl>
## 1 User    700         -1.42       0.713          -1.03          0.441
## 2 LLM     700         -2.08       0.647          -0.676         0.454
## # i 2 more variables: mean_resonance <dbl>, sd_resonance <dbl>
```

```r
knitr::kable(desc_stats, caption = "Descriptive Statistics for Novelty Metrics by Agent", digits = 3)
```

Table 1: Descriptive Statistics for Novelty Metrics by Agent

agent	n	mean_surprise	sd_surprise	mean_transience	sd_transience	mean_resonance	sd_resonance

)
```

2 2. Novelty and Resonance Analysis

2.1 2.1 Resonance vs Novelty Plot

```r
# Plot Resonance vs Novelty (Field Data)
p_resonance <- ggplot(df_res_long, aes(x = surprise, y = resonance, color = agent)) +
  geom_point(alpha = 0.5, size = 1.5) +
  geom_smooth(method = "lm", se = TRUE, fullrange = TRUE, size = 1.2) +
  scale_color_manual(values = c("User" = "#377EB8", "LLM" = "#FF7F00")) +
    geom_vline(data = desc_stats,
               aes(xintercept = mean_surprise, color = agent),
```

```
              linetype = "dashed", linewidth = 0.8, show.legend = FALSE) +
  labs(
    title = "Resonance vs Novelty (Field Data)",
    x = "Novelty",
    y = "Resonance (Novelty - Transience)"
  ) +
  theme_minimal(base_size = 14) +
  theme(legend.position = "top")

print(p_resonance)
```

```
ggsave(file.path(GRAPHS_DIR, "novelty_resonance_vs_novelty.png"),
       p_resonance, width = 12, height = 6, dpi = 300)
```

2.2 2.2 Transience vs Novelty Plot

```
p_transience <- ggplot(df_res_long, aes(x = surprise, y = transience, color = agent)) +
  geom_point(alpha = 0.5, size = 1.5) +
  geom_smooth(method = "lm", se = TRUE, fullrange = TRUE, size = 1.2) +
  scale_color_manual(values = c("User" = "#377EB8", "LLM" = "#FF7F00")) +
      geom_vline(data = desc_stats,
              aes(xintercept = mean_surprise, color = agent),
              linetype = "dashed", linewidth = 0.8, show.legend = FALSE) +
  labs(
    title = "Transience vs Novelty (Field Data)",
    x = "Novelty (Surprisal)",
    y = "Transience"
  ) +
  theme_minimal(base_size = 14) +
  theme(legend.position = "top")

print(p_transience)
```

```
ggsave(file.path(GRAPHS_DIR, "novelty_transience_vs_novelty.png"),
       p_transience, width = 12, height = 6, dpi = 300)
```

3 3. Statistical Models

3.1 3.1 Resonance Model

```
# Model without length control
model_resonance <- lmer(resonance ~ surprise * agent + (1 | conversation_id), data = df_res_long)
cat("=== Resonance Model ===\n")
```

```
## === Resonance Model ===
```

```
print(summary(model_resonance)$coefficients)
```
